# Central dogma of statistics

Parameters are characteristics of the population

**We estimate population parameters  
with the data**

Population

Inference

$$\hat{\theta} = 2/3 \text{ pink symbols}$$

Probability

Sample

But in another sample we might get something different

Population

$$\hat{\theta} = 1/3 \text{ pink symbols}$$

Probability

Sample

Inference

**Goal : what is population quantity and how certain are we?**

$$\bar{X} = \frac{1}{M} \sum_{i=1}^M X_i$$

$$s_X^2 = \frac{1}{M-1} \sum_{i=1}^M (X_i - \bar{X})^2$$

$$CI = \left( \bar{X} - c \frac{s_x}{\sqrt{n}}, \bar{X} + c \frac{s_x}{\sqrt{n}} \right)$$

$$\Pr(\theta \in CI) = f(c)$$

# Notes and further reading

- Inference is a whole class (no joke): <https://www.coursera.org/course/statinference>
- Basic thing to keep in mind is how do you
  - estimate
  - quantify uncertainty
